Claim Rejections - 35 USC § 112

1. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claim 17 is rejected as being of undue breadth. see M.P.E.P. 2164.08 (a). In re Hyatt, 708 F.2d 712, 714-715, 218 USPQ 195, 197 (Fed. Cir. 1983) (A single means claim which covered every conceivable means for achieving the stated purpose was held nonenabling for the scope of the claim because the specification disclosed at most only those means known to the inventor). In this case, "means for adjusting a delay" is the only means recited in the claimed invention.

Allowable Subject Matter

2. Claims 1-16, 22-42 are allowed.
3. Claims 18-21 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
4. The following is a statement of reasons for the indication of allowable subject matter:
Prior art of record, taken individually or collectively, fails to disclose method, apparatus or computer program product for transmitting a signal which (1) varies the delay between the respective phase and amplitude components of symbols responsive to a transmit power for the transmitting signal, or (2) associates respective ones of a plurality of delay values between an amplitude component and a phase component of a test signal with respective ones of the plurality of selected transmit power levels in the manner as claimed.

Art Unit: 2634

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. O'Flaherty et al discloses a method for optimizing power amplifier efficiency wherein amplitude and phase modulation are controlled based on measured output characteristic such as error vector magnitude. Kato et al discloses an circuit for minimizing EVM by correlating the inphase and quadrature digital bit patterns to known EVM scatter patterns.
